How do you calculate the heat transfer area of a plate heat exchanger? The heat load of a heat exchanger can be derived from the following two formulas: 1. Heat load, Theta and LMTD calculation. Where: P = heat load (btu/h) m = mass flow rate (lb/h) cp = specific heat (btu/lb °F) ?t = temperature difference between inlet and outlet on one side (°F) k = heat transfer coefficient (btu/ft² h ...

Plate heat exchanger calculation method - Alfa Laval
The heat exchanger consists of a pack of corrugated metal plates with portholes for the input and output of the two separate fluids. The heat transfer between the two fluids takes place through the plates. The plate pack is assembled between a frame plate and a pressure plate and compressed by tightening bolts.
