

Amber Window To The Past

Eventually, you will utterly discover a further experience and execution by spending more cash. still when? do you assume that you require to get those all needs with having significantly cash? Why don't you attempt to acquire something basic in the beginning? That's something that will guide you to understand even more in this area the globe, experience, some places, once history, amusement, and a lot more?

It is your enormously own times to take steps reviewing habit. in the middle of guides you could enjoy now is amber window to the past below.

Fossils: Window to the past. Amber. What is amber? Amber is fossilized resin of a coniferous tree of early Tertiary. One of the differences between resin and sap is the latter's solubility in water since most of it is water from the xylem (water transporting system) of the tree.

Amber: Window to the Past. Originally published to accompany a 1996 exhibition at the American Museum of Natural History in New York, this volume, now in paperback, explores the properties of amber (fossilized tree resin) and reveals its role in tracing evolutionary history and its use in the decorative arts and jewellery.

Amber from the Cretaceous is further significant since it coincides with the radiation of the angiosperms and major tectonic shifts in continental positions, and precedes the famous end-Cretaceous impact event. Of the seven major deposits of amber from the Cretaceous Period, Burmese amber contains probably the most diverse palaeobiota. For example, approximately 228 families of organisms (primarily arthropods) have been reported from Burmite, compared to a range of 68-125 families ...

Amber: Window to the Past displayed the scientific and artistic aspects of Amber. The exhibition covered a 6,000 square-foot gallery on the first floor of NMNH and included 146 fossil specimens, a diorama of a Dominican amber forest, 94 decorative objects and a film explaining the study of fossilized DNA.

Amber: Window to the Past by David A. Grimaldi (Paperback, 2003) Be the first to write a review.

Illustrates the natural history of amber and its historical uses in art and sculpture with photographs and descriptive text

Amber has captured the human imagination for centuries, as amulets, ritual cups, and beads dating back 10,000 years attest. It is a fascinating substance, one that offers a unique intersection of the fields of paleontology, botany, entomology, and mineralogy. The fossilized resin of ancient trees, amber preserves organic material--most commonly insects and other invertebrates--and with it the shape and surface detail that are usually obliterated or hopelessly distorted during the mineralization we associate with fossils. To look at an ant or a bee caught in amber is to look not at an organism that has been turned to stone, but at the actual remains of an insect that lived hundreds of millions of years ago, remains that retain an uncanny semblance of life. Amber also offers clues to the evolution of certain behaviors, capturing such interactions as parasitism--a fruit fly with a parasitic mite still attached to it--or mutualism--a bubble of gas indicating the presence of beneficial bacteria in the gut of a termite. Unique to this book are identification keys to the most common insect inclusions as well as practical advice on how to identify all-too-common fakes. Amber will bring the study of this and its inclusions within reach of anyone with access to amber and a good magnifying glass.

Discusses these two scientists' work with amber and their successes in extracting 100 million-year-old DNA samples

"Amber is a semi-precious gem that is formed over eons by natural forces out of the resin of trees. Human fascination with amber dates back to prehistoric times, when it was probably considered to have magical powers and was used for adornment and trade. Amber amulets and beads dating from 35,000 to 1,800 B.C. have been found, and where they have been found (for example in graves hundreds of miles from their chemically determined origins) has often helped to establish ancient trade routes." "The preservative qualities of plant resins were well known by the ancients. The Egyptians used resins to embalm their dead, and the Greeks used them to preserve their wine. Amber often preserved fossils, frequently in a pristine state, of all kinds of animal and plant organisms that made contact with the sticky substance and became trapped in it. These fossils include such fragile organisms as nematodes and mushrooms that ordinarily are not preserved under normal processes of fossilization, as well as larger organisms like scorpions and lizards, and the fossils are preserved in their full three-dimensional form, complete with minute details of scales, mouth parts, antennae, and hairs. It has even been suggested that viable DNA may persist in some amber-trapped organisms." "This book is a compendium of all that we know about life found in amber. It surveys all life forms, from microbes to vertebrates and plants, that have been reported from amber deposits throughout the world, beginning with the earliest pieces dating from some 300 million years ago. It also describes the formation of amber and the location, geological history, and early exploration of the major world amber deposits, including those still being worked today." "The book also provides practical information on how to determine fake amber containing present-day forms of life. It can serve as a beginning for tracing the geological history of a particular group of animals or plants or even reconstructing ancient paleoenvironments, and because amber fossils are preserved so completely, in a transparent medium, they can be intimately compared with related living species. Finally, the book discusses what amber fossils can tell us about evolution and speciation, cellular preservation, and paleosymbiosis." "The book is illustrated with 37 color photographs, 154 black-and-white photographs and drawings, and 8 maps."--BOOK JACKET.Title Summary field provided by Blackwell North America, Inc. The science consultant for the popular science fiction TV show discusses the actual scientific research in cell biology, cloning, genetic engineering, aging, hybrid cells, and computer technology that informs the program.

New York magazine was born in 1968 after a run as an insert of the New York Herald Tribune and quickly made a place for itself as the trusted resource for readers across the country. With award-winning writing and photography covering everything from politics and food to theater and fashion, the magazine's consistent mission has been to reflect back to its audience the energy and excitement of the city itself, while celebrating New York as both a place and an idea.

Explains how amber is formed, where it is found, and why it holds a mystical place in our hearts. Explores the role amber plays in the folklore of many cultures, how to detect fake amber, how to care for amber jewelry, and how to use amber for lapidary projects. Photographs illustrate some of the finest amber specimens available.

Most major recent advances in understanding the history of life on Earth have been through the study of exceptionally well preserved biotas (Fossil-Lagerstätten). These are windows on the history of life on Earth and can provide a fairly complete picture of the evolution of ecosystems through time. This book follows the success of Evolution of Fossil Ecosystems by the same authors which covered Fossil-Lagerstätten around the world. The success of the first book prompted this new book which draws on four localities from the original book and adds another ten, all located in North America. Following an introduction to Fossil-Lagerstätten, each chapter deals with a single fossil locality. Each chapter contains a brief introduction placing the Lagerstätte in an

evolutionary context; there then follows a history of study of the locality; the background sedimentology, stratigraphy and palaeoenvironment; a description of the biota; discussion of the palaeoecology, and a comparison with other Lagerstätten of a similar age and/or environment. At the end of the book is an Appendix listing museums in which to see exhibitions of fossils from each locality and suggestions for visiting the sites.
