The new edition of Gene Control has been updated to include significant advances in the roles of the epigenome and regulatory RNAs in gene regulation. The chapter structure remains the same: the first part consists of pairs of chapters that explain the mechanisms involved and how they regulate gene expression, and the second part deals with specific biological processes (including diseases) and how they are controlled by genes. Coverage of methodology has been strengthened by the inclusion more explanation and diagrams. The significant revision and updating will allow Gene Control to continue to be of value to students, scientists and clinicians interested in the topic of gene control.

Gene regulation is an essential process in the development and maintenance of a healthy body, and as such, is a central focus in both basic science and medical research. Gene Regulation, Fifth Edition provides the student and researcher with a clear, up-to-date description of gene regulation in eukaryotes, distilling the vast and complex primary literature into a concise overview.

Levels of gene control -- Structure of chromatin -- Role of chromatin structure in gene control -- The process of transcription -- Transcription factors and transcriptional control -- Post-transcriptional processes -- Post-transcriptional regulation -- Gene control and cellular signaling pathways -- Gene control in embryonic development -- Control of cell-type-specific gene expression -- Gene regulation and cancer -- Gene regulation and human disease -- Conclusions and future prospects.

Genetics and Genomics in Medicine is a new textbook written for undergraduate students, graduate students, and medical researchers that explains the science behind the uses of genetics and genomics in medicine today. Rather than focusing narrowly on rare inherited and chromosomal disorders, it is a comprehensive and integrated account of how geneti

Concentrating on proven data and adopting a structure-function approach, this text provides grounding for an intricate understanding of the molecular biology, physiological mechanisms, and routine clinical use in disease settings of colony-stimulating factors (CSFs). This edition includes eight additional chapters, with updates of recently-discovered and established CSFs, each indexed individually.

During the past decades, with the introduction of the recombinant DNA, hybridoma and transgenic technologies there has been an exponential evolution in understanding the pathogenesis, diagnosis and treatment of a large number of human diseases. The technologies are evident with the development of cytokines and monoclonal antibodies as therapeutic agents and the techniques used in gene therapy. Immunopharmacology is that area of biomedical sciences where immunology, pharmacology and pathology overlap. It concerns the pharmacological approach to the immune response in physiological as well as pathological events. This goals and objectives of this textbook are to emphasize the developments in immunology and pharmacology as they relate to the modulation of immune response. The information includes the pharmacology of cytokines, monoclonal antibodies, mechanism of action of immune-suppressive agents and their relevance in tissue transplantation, therapeutic strategies for the treatment of AIDS and the techniques employed in gene therapy. The book is intended for health care professional students and graduate students in pharmacology and immunology.

Aegean Conferences is an independent, nonprofit, educational organization directed and managed by the scientific community. The board is made up of nine researchers/scientists in various disciplines from Harvard, Brown, University of Pennsylvania, UCSD, Princeton, Biovista and the Foundation for Biomedical Research Academy of Athens. The board both invites and approves unsolicited proposals for Conferences in all fields of Science, Engineering, Arts, and Humanities. The purpose of the Conferences is to bring together individuals with common interests to examine the emerging and most advanced aspects of their particular field. The Symposium on Ovarian Cancer: State of the Art and Future Directions intends to bring together international experts interested in the development of novel diagnostic, prognostic and therapeutic tools for ovarian cancer. The meeting will function as a think tank where clinicians, translational and basic scientists, and parties from the biotechnology and pharmaceutical industry will get together to review recent advances in clinical research and translational science in ovarian cancer and define areas of future research opportunities and priorities.
