What is time-sensitive networking (TSN)? In its simplest form, TSN is the IEEE 802.1Q defined standard technology to provide deterministic messaging on standard Ethernet. TSN technology is centrally managed and delivers guarantees of delivery and minimized jitter using time scheduling for those real-time applications that require determinism.

IEEE 802.1 working group. The TSN task group was formed in November 2012 by renaming the existing Audio Video Bridging Task Group and continuing its work. The name changed as a result of the extension of the working area of the standardization group. The standards define mechanisms for the time-sensitive transmission of data over deterministic Ethernet networks. The majority of pr

Time Sensitive Networking: An Introduction to TSN

Time Sensitive Networks: Real-Time Ethernet. by Thomas Brand Download PDF. Discussions on Ethernet are giving rise to increasing demands for secure data transmission and real-time. This is where the issue of time sensitive networking (TSN), a combination of several substandards developed within the framework of the IEEE 802 Time-Sensitive Networking Task Group (TSN TG), comes into play.

Time Sensitive Networks: Real-Time Ethernet | Analog Devices

Abstract: A number of companies and standards development organizations have, since 2000, been producing products and standards for "time-sensitive networks" to support real-time applications that require a) zero packet loss due to buffer congestion, b) extremely low packet loss due to equipment failure, and c) guaranteed upper bounds on end-to-end latency. Often, a robust capability for time synchronization to less than 1 μ s is also required.

Time-sensitive networking (TSN) is an Ethernet extension defined by the Institute of Electrical and Electronic Engineers (IEEE) designed to make Ethernet-based networks more deterministic. Industries like automotive, industrial and performance audio use real-time communication with multiple network devices and will benefit from the TSN standard.
